

Overview - Cleaning of the

RAW WATER POND

JUNE 27 -CANADIAN DE-WATERING

Canadian DE-Watering (CDW) arrive and set up a floating dredge to clean the bottom of the pond, pumping out the sludge and slurry. Water that can be recovered will be cleaned and pumped back into the Raw Water Pond.

NATURAL PROCESS

A natural settling process will be used instead of a mechanical system. No chemicals will be needed to extract the water out of the sludge.

RIVER SILT AND SAND

The material being removed from the Raw Water Pond is natural, comprising mostly of river silt and sand. It will be left in a low-lying area that would have needed to be leveled in the future.

MID-JUNE - ROAD UPGRADE

Prepping the road to the Raw Water Pond, so that heavy vehicles can travel on it.

DAYTIME OPERATION MONDAYS-FRIDAYS

CDW will only work Monday-Fridays and during daytime hours. This will minimize the noise and disruption that the cleanup process will have on nearby residences.

LENGTH - 1.5 TO 3 MONTHS

The time it will take is unknown as it depends on how much sludge can be removed. The estimate is 1.5 to 3 months from start (set up) to finish (removal of equipment)..
